Grammar for Simple Imperative Programming Language

The Language

$$S ::= skip$$

$$| u := A$$

$$| S_1; S_2$$

$$| if B then S_1 else S_2 fi$$

$$| while B do S_1 od$$

$$B ::= E \sim E$$

$$| true | false$$

$$E ::= u$$

$$| int$$

$$| E \oplus E$$

The Downarrow Notation

 \blacktriangleright In small step semantics we use the \rightarrow to represent one step of computations.

► In big step semantics we use \Downarrow to represent an entire evaluation. Statements $<\mathsf{S}, \sigma>\Downarrow \sigma'$

Expressions

Booleans

 $< {\it E}, \sigma > \Downarrow_{\it e} {\it v}$

 $< B, \sigma > \Downarrow_b b$

• Let *u* be a possibly subscripted variable.

► *E* represents arithmetic expressions, ⊕ is an arithmetic operator.

Next is **while**. There are two rules for this. See if you can guess what the rules looks like. The second one uses induction!

- To show the effect of a program, we need to build proof trees.
- Let $\sigma = \{x := 3, y := 4\}.$
- We want to prove that $2 \times y + 9 \times x = 35$.

Because of precedence rules, we evaluate the + last.

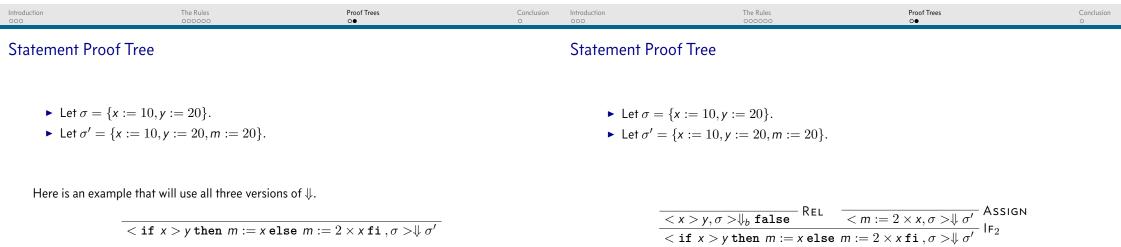

$$\frac{\boxed{<2 \times \mathbf{y}, \sigma > \Downarrow_{\mathbf{e}} 8} \quad \boxed{<9 \times \mathbf{x}, \sigma > \Downarrow_{\mathbf{e}} 27}}{<2 \times \mathbf{y} + 9 \times \mathbf{x}, \sigma > \Downarrow_{\mathbf{e}} 35} \mathsf{Arith}$$

- To show the effect of a program, we need to build proof trees.
- Let $\sigma = \{x := 3, y := 4\}.$
- We want to prove that $2 \times y + 9 \times x = 35$.

We go up one more level, and then we are done.

$$\frac{ \overbrace{<2,\sigma>\Downarrow_{e}2}^{} \operatorname{Const} }{ \underbrace{<2\times y,\sigma>\Downarrow_{e}8}^{} \operatorname{Arith} } \frac{\operatorname{Var}_{} \operatorname{Arith} }{ \underbrace{<9,\sigma>\Downarrow_{e}9}^{} \operatorname{Const} } \frac{ \overbrace{\Downarrow_{e}3}^{} \operatorname{Var}_{} \operatorname{Arith} }{ \underbrace{<9\times x,\sigma>\Downarrow_{e}27}^{} \operatorname{Arith} } \operatorname{Arith} }$$

Statement Proof Tree

Connecting to Interpreters

- Let $\sigma = \{x := 10, y := 20\}.$
- Let $\sigma' = \{x := 10, y := 20, m := 20\}.$

- The \Downarrow is really just eval that you already know and love.
- The σ is just the env parameter.
