# Fixing Non-LL Grammars

#### Dr. Mattox Beckman

University of Illinois at Urbana-Champaign Department of Computer Science

▲□▶ ▲掃▶ ▲臣▶ ★臣▶ ―臣 … のへで

## Objectives

Last time we talked about grammars cannot be parsed using LL. Here we will try to fix them.

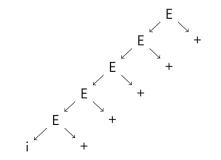

- Eliminate left recursion and mutual left recursion from a grammar.
- Eliminate common prefixes from a grammar.
- Detect and eliminate conflicts with FIRST and FOLLOW sets.

Introduction	Eliminating Left Recursion	Eliminating Common Prefixes	FIRST/FOLLOW conflicts
0	000000000	00	00

## The Idea

Consider deriving i++++ from the following grammar:

- $E \rightarrow E +$  "We can have as many +s as we want at the end of the sentence."
- $E \rightarrow i$  "The first word must be an i."

## More Complicated Example

Consider the following grammar. What does it mean?

 $B \to Bxy \mid Bz \mid q \mid r$ 

- At the end can come any combination of x y or z.
- At the beginning can come q or r.

## Eliminating the Left Recursion

We can rewrite these grammars  $\begin{array}{c} E \rightarrow E + \mid i \\ B \rightarrow Bxy \mid Bz \mid q \mid r \end{array}$  using the following transformation:

• Productions of the form  $S \rightarrow \beta$  become  $S \rightarrow \beta S'$ .

- Productions of the form  $S \rightarrow S\alpha$  become  $S' \rightarrow \alpha S'$ .
- $Add S' \to \epsilon. \\ Result: \begin{array}{c} E \to iE' \\ E' \to +E' \mid \epsilon \\ B \to qB' \mid rB' \\ B' \to xyB' \mid zB' \mid \epsilon \end{array}$

## **Mutual Recursions!**

Things are slightly more complicated if we have mutual recursions.

 $\begin{array}{l} A \rightarrow Aa \mid Bb \mid Cc \mid q \\ B \rightarrow Ax \mid By \mid Cz \mid rA \\ C \rightarrow Ai \mid Bj \mid Ck \mid sB \end{array}$ 

How to do it:

- Take the first symbol (A) and eliminate immediate left recursion.
- Take the second symbol (B) and substitute left recursions to A. Then eliminate immediate left recursion in B.
- Take the third symbol (C) and substitute left recursions to A and B. Then eliminate immediate left recursion in C.

## Left Recursion Example

Here is a more complex left recursion.

 $A \rightarrow Aa \mid Bb \mid Cc \mid q$   $B \rightarrow Ax \mid By \mid Cz \mid rA$   $C \rightarrow Ai \mid Bj \mid Ck \mid sB$ First we eliminate the left recursion from A.  $A \rightarrow Aa \mid Bb \mid Cc \mid q$ This is the result:  $A \rightarrow BbA' \mid CcA' \mid qA'$ 

$${\cal A}' o {\sf a} {\cal A}' \mid \epsilon$$

▲□▶▲□▶▲□▶▲□▶▲□ ● ● ●

## Left Recursion Example, 2

We substituting in the new definition of *A*, and now we will work on the *B* productions.  $A \rightarrow BbA' \mid CcA' \mid qA'$  $A' \rightarrow aA' \mid \epsilon$ 

 $B \rightarrow Ax \mid By \mid Cz \mid rA$ 

 $C \rightarrow Ai \mid Bj \mid Ck \mid sB$ First, we eliminate the "backward" recursion from B to A.

Start:  $B \rightarrow Ax$ 

Result:  $B \rightarrow BbA'x \mid CcA'x \mid qA'x$ 

## Left Recursion Example, 3

 $A \rightarrow BbA' \mid CcA' \mid qA' A' \rightarrow aA' \mid \epsilon$ 

 $B \rightarrow BbA'x \mid CcA'x \mid qA'x \mid By \mid Cz \mid rA$ 

 $C \rightarrow Ai \mid Bj \mid Ck \mid sB$ 

Now we can eliminate the simple left recursion in *B*:  $B \rightarrow CcA'xB' \mid qA'xB' \mid CzB' \mid rAB'$ 

 $B \rightarrow CCA XB | qA XB | CZB | rA$  $B' \rightarrow bA' XB' | yB' | \epsilon$ 

## Left Recursion Example, 4

 $A \rightarrow BbA' | CcA' | qA'$   $A' \rightarrow aA' | \epsilon$   $B \rightarrow CcA'xB' | qA'xB' | CzB' | rAB'$   $B' \rightarrow bA'xB' | yB' | \epsilon$   $C \rightarrow Ai | Bj | Ck | sB$ 

Now production C: First, replace left recursive calls to A ...

 $C \rightarrow B bA'i | CcA'i | qA'i | B j | Ck | sB$ 

Next, replace left recursive calls to B (this gets messy) ...

$$C \rightarrow \begin{array}{c} CcA'xB' \ bA'i \mid \ qA'xB' \ bA'i \mid \ CzB' \ bA'i \mid \ rAB' \ bA'i \\ \hline CcA'xB' \ j \mid \ qA'xB' \ j \mid \ CzB' \ j \mid \ rAB' \ j \\ \hline CcA'i \mid qA'i \mid Ck \mid sB \end{array}$$

## Left Recursion Example, 5

Reorganizing *C*, we have:

Eliminating left recursion gives us:

 $C \rightarrow qA'xB'bA'i | rAB'bA'i | qA'xB'j | rAB'j | qA'i | sB$  CcA'xB'bA'i | CzB'bA'i | CcA'xB'j | CzB'j | CcA'i | Ck  $C \rightarrow qA'xB'bA'iC' | rAB'bA'iC' | qA'xB'jC'$  | rAB'jC' | qA'iC' | sBC'ives us:  $C' \rightarrow cA'xB'bA'iC' | zB'bA'iC' | cA'xB'jC'$   $| zB'jC' | cA'iC' | kC' | \epsilon$

#### The Result

Our final grammar:

$$\begin{array}{l} A \rightarrow BbA' \mid CcA' \mid qA' \\ A' \rightarrow aA' \mid \epsilon \\ B \rightarrow CcA'xB' \mid qA'xB' \mid CzB' \mid rAB' \\ B' \rightarrow bA'xB' \mid yB' \mid \epsilon \\ C \rightarrow qA'xB'bA'iC' \mid rAB'bA'iC' \mid qA'xB'jC' \\ \mid rAB'jC' \mid qA'iC' \mid sBC' \\ C' \rightarrow cA'xB'bA'iC' \mid zB'bA'iC' \mid cA'xB'jC' \\ \mid zB'jC' \mid cA'iC' \mid kC' \mid \epsilon \end{array}$$

Beautiful, isn't it? I wonder why we don't do this more often?

Disclaimer: If there is a cycle (A →<sup>+</sup> A) or an epsilon production (A → ε) then this technique is not guaranteed to work.

## Common Prefix

This grammar has common prefixes.

$$A \rightarrow xyB \mid CyC \mid q$$
$$B \rightarrow zC \mid zx \mid w$$
$$C \rightarrow y \mid x$$

To check for common prefixes, take a nonterminal and compare the FIRST sets of each production.

ProductionFirstSetIf we are viewing an A, we will want to look at the $A \rightarrow xyB$  $\{x\}$ next token to see which A production to use. If that $A \rightarrow CyC$  $\{x,y\}$ token is x, then which production do we use? $A \rightarrow q$  $\{q\}$

## Left Factoring

If 
$$A \to \alpha \beta_1 \mid \alpha \beta_2 \mid \gamma$$
 we can rewrite it as  $\begin{array}{c} A \to \alpha A' \mid \gamma \\ A' \to \beta_1 \mid \beta_2. \end{array}$ 

So, in our example:

$$\begin{array}{lll} A \rightarrow xyB \mid CyC \mid q & \text{becomes} & A \rightarrow xA' \mid q \mid yyC \\ B \rightarrow zC \mid zx \mid w & A' \rightarrow yB \mid yC \\ C \rightarrow y \mid x & B \rightarrow zB' \mid w \\ & B' \rightarrow C \mid x \\ & C \rightarrow y \mid x. \end{array}$$

Sometimes you'll need to do this more than once. Note that this process can destroy the meaning of the nonterminals.

#### **Epsilon Productions**

Epsilon productions have to be handled with care.

$$egin{array}{ccc} A & o & Bc \ & & | & x \ B & o & c \ & & | & \epsilon \end{array}$$

Is this LL?

#### **Epsilon Productions**

$$egin{array}{ccc} A & o & Bc \ & & | & x \ B & o & c \ & & | & \epsilon \end{array}$$

- FOLLOW(B) =  $\{c\}$ , and FIRST(B) =  $\{c\}$ , so we have a conflict when trying to parse B.
- We can substitute the *B* rule into the *A* rule to fix this ...
- Be sure to check if you have introduced a common prefix though!

$$\begin{array}{cccc} A \rightarrow & cc & & & A \rightarrow & cA' \\ | & c & & & & \\ | & x & & & & A' \rightarrow & c \\ | & \epsilon & & & & \\ \end{array}$$
