

Polytype Semantics

Dr. Mattox Beckman

UNIVERSITY OF ILLINOIS AT URBANA-CHAMPAIGN
DEPARTMENT OF COMPUTER SCIENCE

Objectives

- ▶ Use the `Gen` and `Inst` rules to introduce polymorphic types.
- ▶ Explain the \forall syntax in type signatures.
- ▶ Explain the type difference between `let` and function application.
- ▶ Draw some proof trees for polymorphically typed programs.

The Language

- ▶ We are going to type λ -calculus extended with let, if, arithmetic, and comparisons.

$L ::= \lambda x.L$	abstractions
$L L$	applications
$\text{let } x = L \text{ in } L$	let expressions
$\text{if } L \text{ then } L \text{ else } L \text{ fi}$	if expressions
E	expressions
$E ::= x$	variables
n	integers
b	booleans
$E \oplus E$	integer operations
$E \sim E$	integer comparisons
$E \&& E$	boolean and
$E E$	boolean or

Remember the Let Rule?

- ▶ Remember this rule for let :

$$\frac{\Gamma \vdash e_1 : \sigma \quad \Gamma \cup [x : \sigma] \vdash e_2 : \tau}{\Gamma \vdash \text{let } x = e_1 \text{ in } e_2 : \tau} \text{LET}$$

- ▶ We cannot type check things like this:

```
1 let f = \x -> x in (f "hi", f 30)
```

- ▶ What is the type of id here?

```
1 id x = x
```

Type Variables in Rules

A *monotype* τ can be a

- ▶ Type constant (e.g., Int, Bool, etc.)
- ▶ Instantiated type constructor (e.g., [Int], Int \rightarrow Int)
- ▶ A type variable α

A *polytype* σ can be a

- ▶ Monotype τ
- ▶ Qualified type $\forall \alpha. \sigma$

```
1 {-# LANGUAGE ScopedTypeVariables #-}
```

```
2 id :: forall a . a -> a
```

```
3 id x = x
```

- ▶ The UnicodeSyntax extension allows us to put \forall directly in the source code.
`id :: \forall a . a -> a`

Monotypes and Polytypes

```
1 -- Some Haskell polytype functions
2 head :: forall a . [a] -> a
3 length :: forall a . [a] -> Int    -- sort of
4 id :: forall a . a -> a
5 map :: forall a b . (a -> b) -> [a] -> [b]    -- sort of
```

- ▶ In HASKELL, the forall part is **implicit at the top level!**

Some Rules

- Monomorphic variable rule:

$$\frac{}{\Gamma \vdash x : \tau} \text{VAR, if } x : \tau \in \Gamma$$

- Polymorphic variable rule:

$$\frac{}{\Gamma \vdash x : \sigma} \text{VAR, if } x : \sigma \in \Gamma$$

- The function and application rules are the same as before.

$$\frac{\Gamma \vdash e_1 : \alpha_2 \rightarrow \alpha \quad \Gamma \vdash e_2 : \alpha_2}{\Gamma \vdash e_1 e_2 : \alpha} \text{APP}$$

$$\frac{\Gamma \cup \{x : \alpha_1\} \vdash e : \alpha_2}{\Gamma \vdash \lambda x. e : \alpha_1 \rightarrow \alpha_2} \text{ABS}$$

Leveling Up Let

- ▶ Here is the old let rule again.

$$\frac{\Gamma \cup [x : \tau_1] \vdash e_2 : \tau_2 \quad \Gamma \vdash e_1 : \tau_1}{\Gamma \vdash \text{let } x = e_1 \text{ in } e_2 : \tau_2} \text{LET}$$

- ▶ Here is our new one.

$$\frac{\Gamma \cup [x : \sigma_1] \vdash e_2 : \tau_2 \quad \Gamma \vdash e_1 : \sigma_1}{\Gamma \vdash \text{let } x = e_1 \text{ in } e_2 : \tau_2} \text{LET}$$

Gen and Inst

Gen

$$\frac{\Gamma \vdash e : \sigma}{\Gamma \vdash e : \forall \alpha. \sigma}, \text{ where } \alpha \text{ is not free in } \Gamma$$

Example:

$$\frac{\Gamma \vdash \lambda x. x : \alpha \rightarrow \alpha}{\Gamma \vdash \lambda x. x : \forall \alpha. \alpha \rightarrow \alpha} \text{ GEN}$$

Inst

$$\frac{\Gamma \vdash e : \sigma'}{\Gamma \vdash e : \sigma}, \text{ when } \sigma' \geq \sigma$$

Example:

$$\frac{\Gamma \vdash id : \forall \alpha. \alpha \rightarrow \alpha}{\Gamma \vdash id : \text{Int} \rightarrow \text{Int}} \text{ INST}$$

Type Hierarchy

- ▶ What is $\sigma \geq \sigma'$?
- ▶ We can get σ' from $\forall\alpha.\sigma$ by consistently replacing a particular α with a monotype τ and removing the quantifier.
- ▶ Type variables in the result that are free can be quantified.
- ▶ Examples:

$$\forall\alpha.\alpha \rightarrow \alpha \geq \text{Int} \rightarrow \text{Int}$$

$$\forall\alpha.\alpha \rightarrow \alpha \geq \text{Bool} \rightarrow \text{Bool}$$

$$\forall\alpha.\alpha \rightarrow \alpha \geq \forall\beta.\beta \rightarrow \beta$$

t

- ▶ Nonexamples:

$$\forall\alpha.\alpha \rightarrow \alpha \geq \text{Int} \rightarrow \text{Bool}$$

$$\forall\alpha.\alpha \rightarrow \alpha \geq \alpha \rightarrow \text{Bool}$$

$$\forall\alpha.\alpha \rightarrow \alpha \geq \forall\beta.\beta \rightarrow \text{Int}$$

Example 1

To prove:

$$\frac{}{\Gamma \equiv \{ \text{id} : \forall \alpha. \alpha \rightarrow \alpha, n : \text{Int} \} \vdash \text{id} n : \text{Int}}$$

Example 1

$$\frac{\Gamma \vdash \text{id} : \text{Int} \rightarrow \text{Int}}{\Gamma \equiv \{\text{id} : \forall \alpha. \alpha \rightarrow \alpha, \text{n} : \text{Int}\} \vdash \text{id} \text{ n} : \text{Int}} \text{INST} \quad \frac{\Gamma \vdash \text{n} : \text{Int}}{\Gamma \vdash \text{id} \text{ n} : \text{Int}} \text{APP}$$

Example 1

$$\frac{\Gamma \vdash \text{id} : \forall \alpha. \alpha \rightarrow \alpha \quad \forall \alpha. \alpha \rightarrow \alpha \geq \text{Int} \rightarrow \text{Int}}{\Gamma \vdash \text{id} : \text{Int} \rightarrow \text{Int}} \text{ VAR} \quad \text{INST} \quad \frac{\Gamma \vdash n : \text{Int}}{\Gamma \equiv \{\text{id} : \forall \alpha. \alpha \rightarrow \alpha, n : \text{Int}\} \vdash \text{id } n : \text{Int}} \text{ APP}$$

Example 2

To prove:

$$\frac{}{\Gamma \equiv \{\} \vdash \text{let } f = \lambda x.x \text{ in } f : \forall \alpha. \alpha \rightarrow \alpha} \text{LET}$$

Example 2

To prove:

$$\frac{\frac{\frac{\frac{x : \alpha}{\{x : \alpha\} \vdash x : \alpha} \text{ VAR}}{\{\} \vdash \lambda x. x : \alpha \rightarrow \alpha} \text{ ABS}}{\{\} \vdash \lambda x. x : \forall \alpha. \alpha \rightarrow \alpha} \text{ GEN}}{\Gamma \equiv \{\} \vdash \text{let } f = \lambda x. x \text{ in } f : \forall \alpha. \alpha \rightarrow \alpha} \text{ LET}$$

A Weird Thing about Let and Functions

- ▶ The two following expressions would seem to be equivalent, yes?

- ▶ Expression 1:

```
1 let f = \ x -> x in (f "hi", f 10)
```

- ▶ Expression 2:

```
1 (\f -> (f "hi", f 10)) (\x -> x)
```

- ▶ Try this at home and see what happens!

What Happens ...

- ▶ What's going on here?

```
1 Main> let f = \x -> x in (f "hi", f 10)
2 ("hi",10)
3 Main> (\f -> (f "hi", f 10)) (\x -> x)
4
5      No instance for (Num [Char]) arising from the literal `10'
6      In the first argument of `f', namely `10'
7      In the expression: f 10
8      In the expression: (f "hi", f 10)
```

Type Checking the Troublemaker

- ▶ Add pairs to our list of type constructors.
- ▶ Type check this:

$$\frac{}{\{ \} \vdash (\lambda f . (f \text{ "hi"}, f \ 10)) (\lambda x . x) : (\text{String}, \text{Int})} \text{App}$$

- ▶ And then type check this:

$$\frac{}{\{ \} \vdash \text{let } f = (\lambda x . x) \text{ in } (f \text{ "hi"}, f \ 3) : (\text{String}, \text{Int})} \text{Let}$$
